

*Improving capacity on integrated coastal management with low impact development considering environmental sustainability and climate change in coastal area of Cambodia*  
*ITC (Cambodia), IRD (France), Kyoto University (Japan), and RUA (Cambodia)*

Background

- The relationship between cities and climate change has been under discussion by researchers and policymakers
- Urbanization is related to the climate change issue in at least two ways (WMO, 1996):
  1. A major source of greenhouse gases through energy consumption and transportation
  2. The rapidly increasing urban populations use more and more marginal land, it is augmenting the potential impacts of climate change
- Integration of climate change mitigation and adaptation into urban planning
- Maintains the sustainable development of emerging cities (i.e., coastal area)
- Need to improve the capacity on integrated coastal management (ICM) with low impact development (LID).
- The urban planning process to integrate with green infrastructure, ecosystem-based adaptation, and LID in order to improve the living conditions and renature the city landscape.

Objectives

To support the integration of best practices in LID with urban planning process through scenario evaluation platform, workshops, and instruction materials that involve the participation of city planners, policymakers, practitioners, and citizens.

In order to address in-depth, the aforementioned needs, the project aims to:

1. Develop resources to support the decision-making process (in the analysis of the best and suitable LID scheme to implement and integrate into the urban planning process in the coastal area of Cambodia);
2. Improve the participation of urban residents in evaluating suitable LID and its practices for the urban environment;
3. Support dissemination of best practice in the integration of LID in urban planning process focused on climate change mitigation and adaptation and efficient water management;
4. Foster knowledge exchange forum among academia, practitioners, decision-makers, and local people through a discussion forum in the dissemination workshop.

Key technologies and approaches introduced

1. Apply scientific modeling tool for scenario analysis on land-use and climate change impact.
2. Propose the scenario analysis (land-use change + climate change impact scenarios) of the applying LID or SCC in study area.
3. Sea-level rise estimation for Cambodian coastline based on Climate Model output.
4. Construct sea-level rise inundation maps based on the elevation data and sea-level rise estimated.
5. Dissemination, forum discussion, engagement, and training workshops.
6. Baseline and Endline survey of LID concept among practitioners, urban planners, decision-makers, local governors, and local people => track the impact of the project and awareness raising on LID concept through interaction with interviewers
7. Scientific publication + model manual for scenario evaluation + LID practice manual + urban planning policy

Outputs and key activities

- Water level sensor installation for sea level data collection at Kep, Kampot, Preah Sihanouk
- Drainage surveying data for Khemera Phumin city, Koh Kong province
- PCSWMM purchased and set-up
- Forum discussion, dissemination, and training workshops
  - Baseline survey on knowledge of LID among related people
  - Forum discussion + Dissemination Workshop in Kampot (Preparing)

Implementation progress

- Three water level sensor have been installed in 3 different location of Kep and Kampot province to record the 15 minute-water level data.
- The sea level data at Preah Sihanouk province will be provided from the another project with IRD
- About 50 percent of drainage and street elevation data of Khamera Phumin city have been surveyed in May and plan to finish in next field work.
- Had collected 209 households for baseline survey among the four provinces: Preah Sihanouk, Kep, Kampot, and Koh Kong province
- Interviewed with 28 key stakeholders such as government and sub-national government, NGOs and development agencies
- Had written transcripts of Key informant interview
- Entry, cleaned, and analyzed data
- Preparing the first draft of baseline survey report
- Preparing for coming of consultative workshop (21<sup>st</sup> to 23<sup>rd</sup> of July 2022)

Key challenges and lessons learnt

- The location for water level sensor installation need to meet the criteria such the strength of structure, the effect of tidal, and accessibility.
- Private properties tend to have a better security to prevent from stolen; however, it is quiet challenging to get the permission and collaboration from the owners.
- The drainage, elevation survey during rainy season slow down the progress since the equipment has less water resistance
- Processing of administrative documents in some provinces were very slow
- Difficult to make appointment with some Provincial Departments, private sectors, and National Institutions
- Have some challenges regarding the survey with households because city people have no time for interviewing

# Baseline study on Improving capacity on integrated coastal management with low impact development considering environmental sustainability and climate change in the coastal area of Cambodia

## Introduction

### Background

- Current issues: climate change, lack of data set, level of understanding on LID concepts is not clearly examined for implementation and decision making
  - Studied areas: Koh Kong (Khemara Phumin city), Preah Sihanouk (Krong Preah Sihanouk), Kampot (Krong Kampot), and Kep cities (Krong Kep)
  - Conducted baseline survey: to alter possible scenarios by considering factors to look for optimum scenarios that minimize the risk of flooding and water supply shortage due to drought
- The project: apply primary and secondary data collection from different sources with relevant stakeholders (National Institutions, Provincial Department, NGOs, Development Partners, and Private sectors)

### Objective of Baseline survey

- Our survey consists of 3 main objectives as following:
  1. To understand institutional management regarding LID at coastal,
  2. To understand the behaviors, knowledge, attitudes and practices of people on LID and climate change;
  3. To examine the willingness and awareness to engage in LID as well as provide the future key recommendation for relevant stakeholders.

## Materials and Methods

### Study area

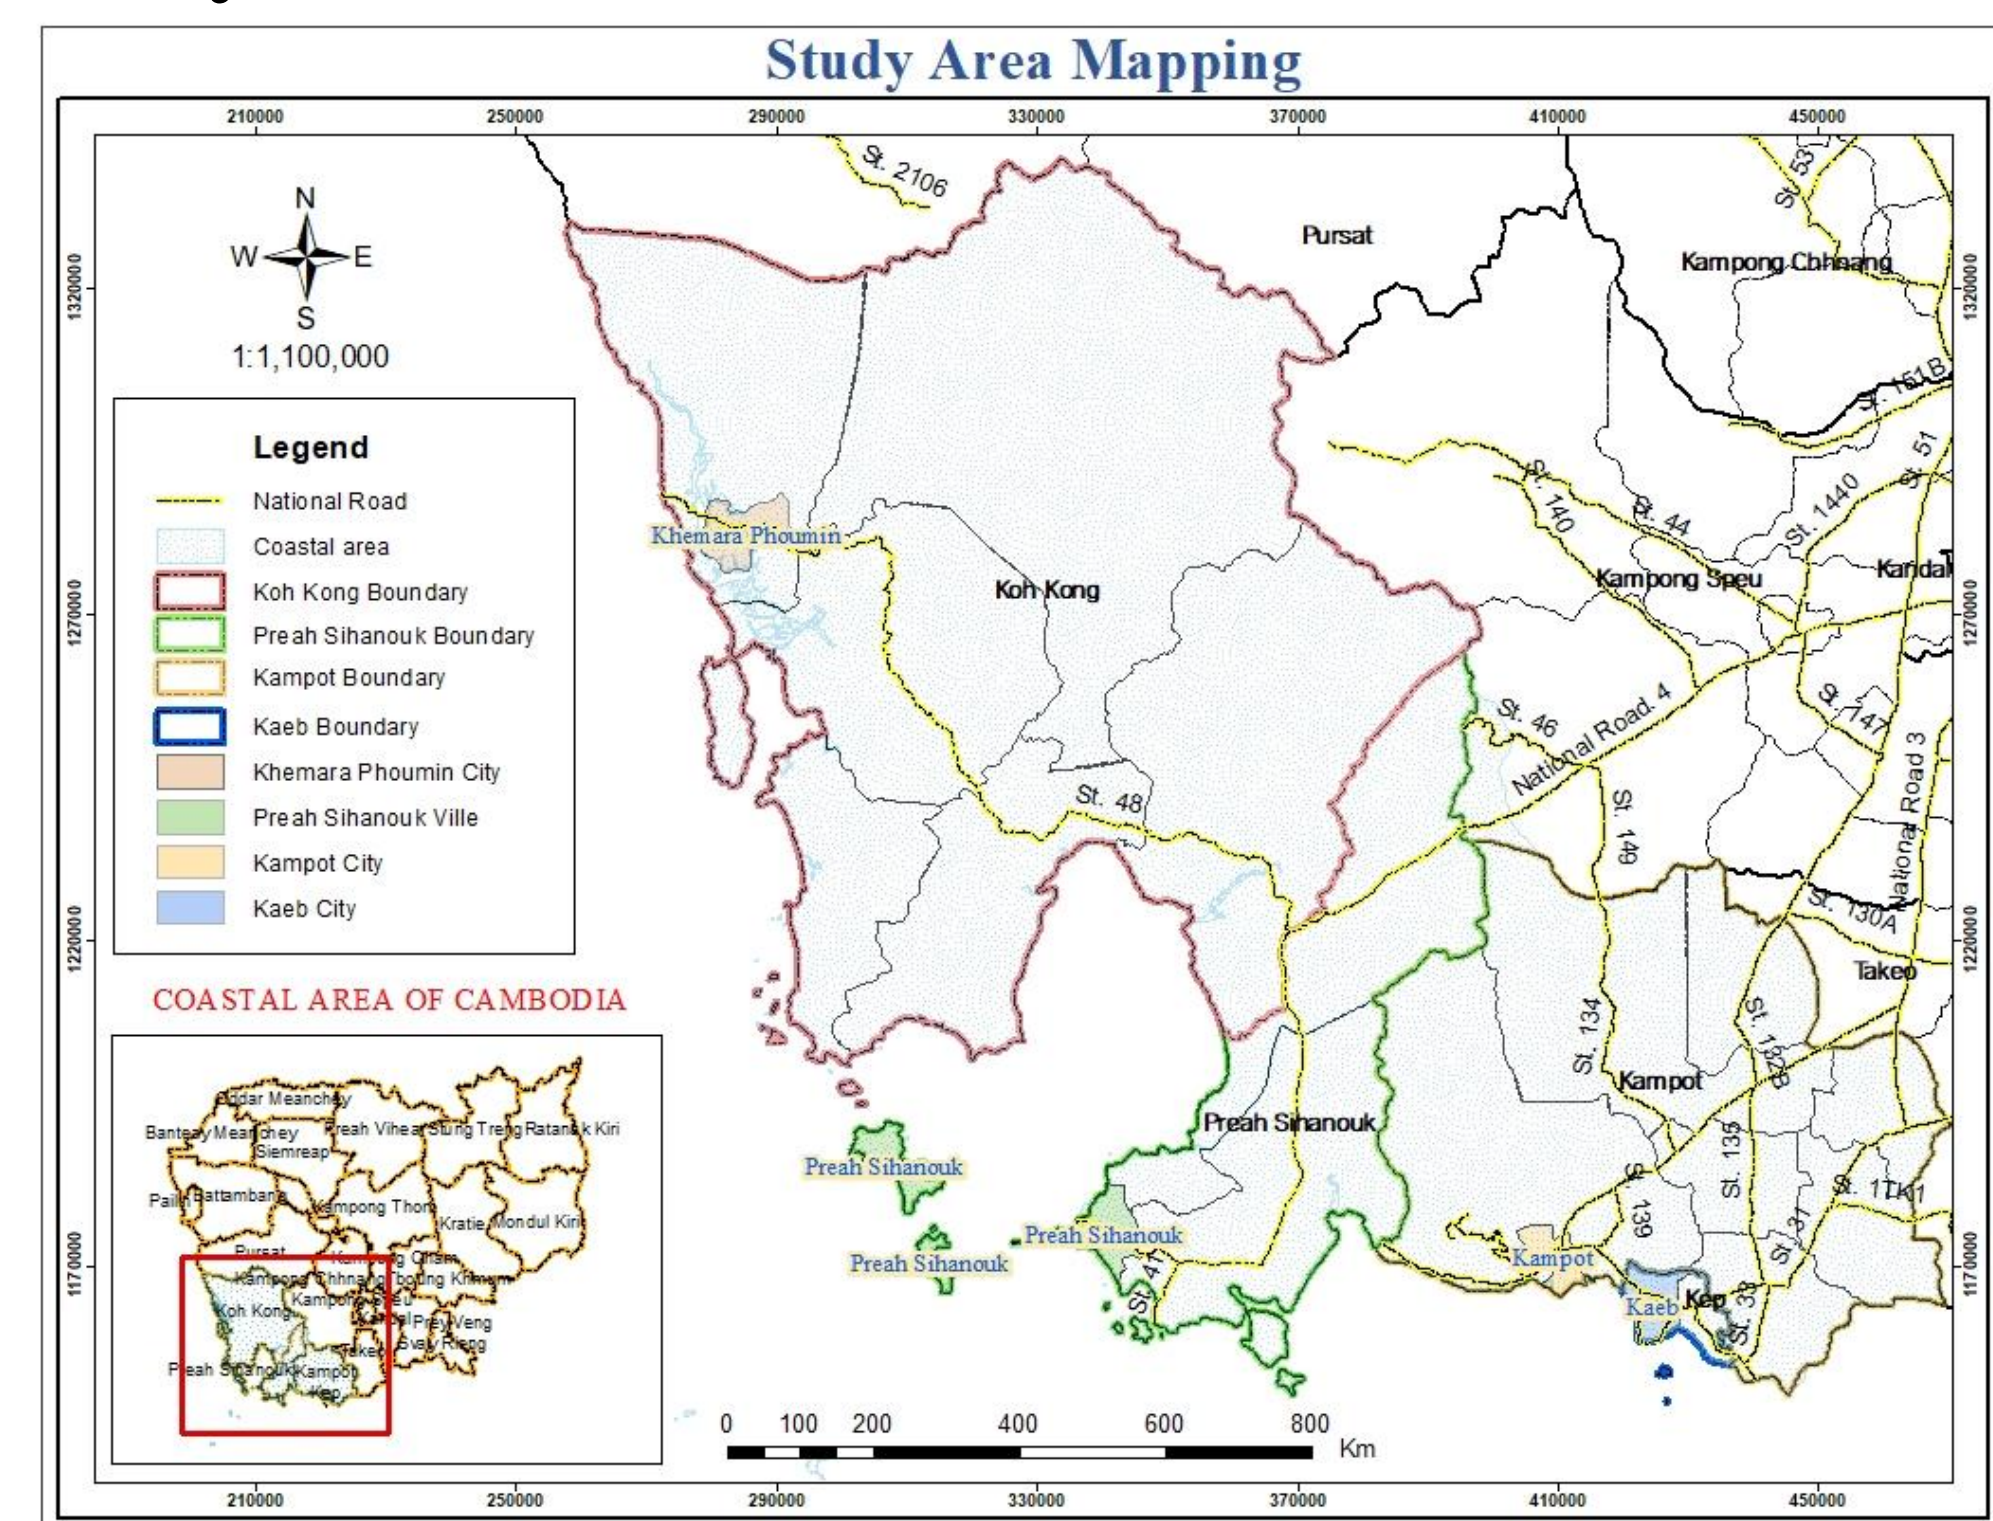

Figure 1 Map of Study area

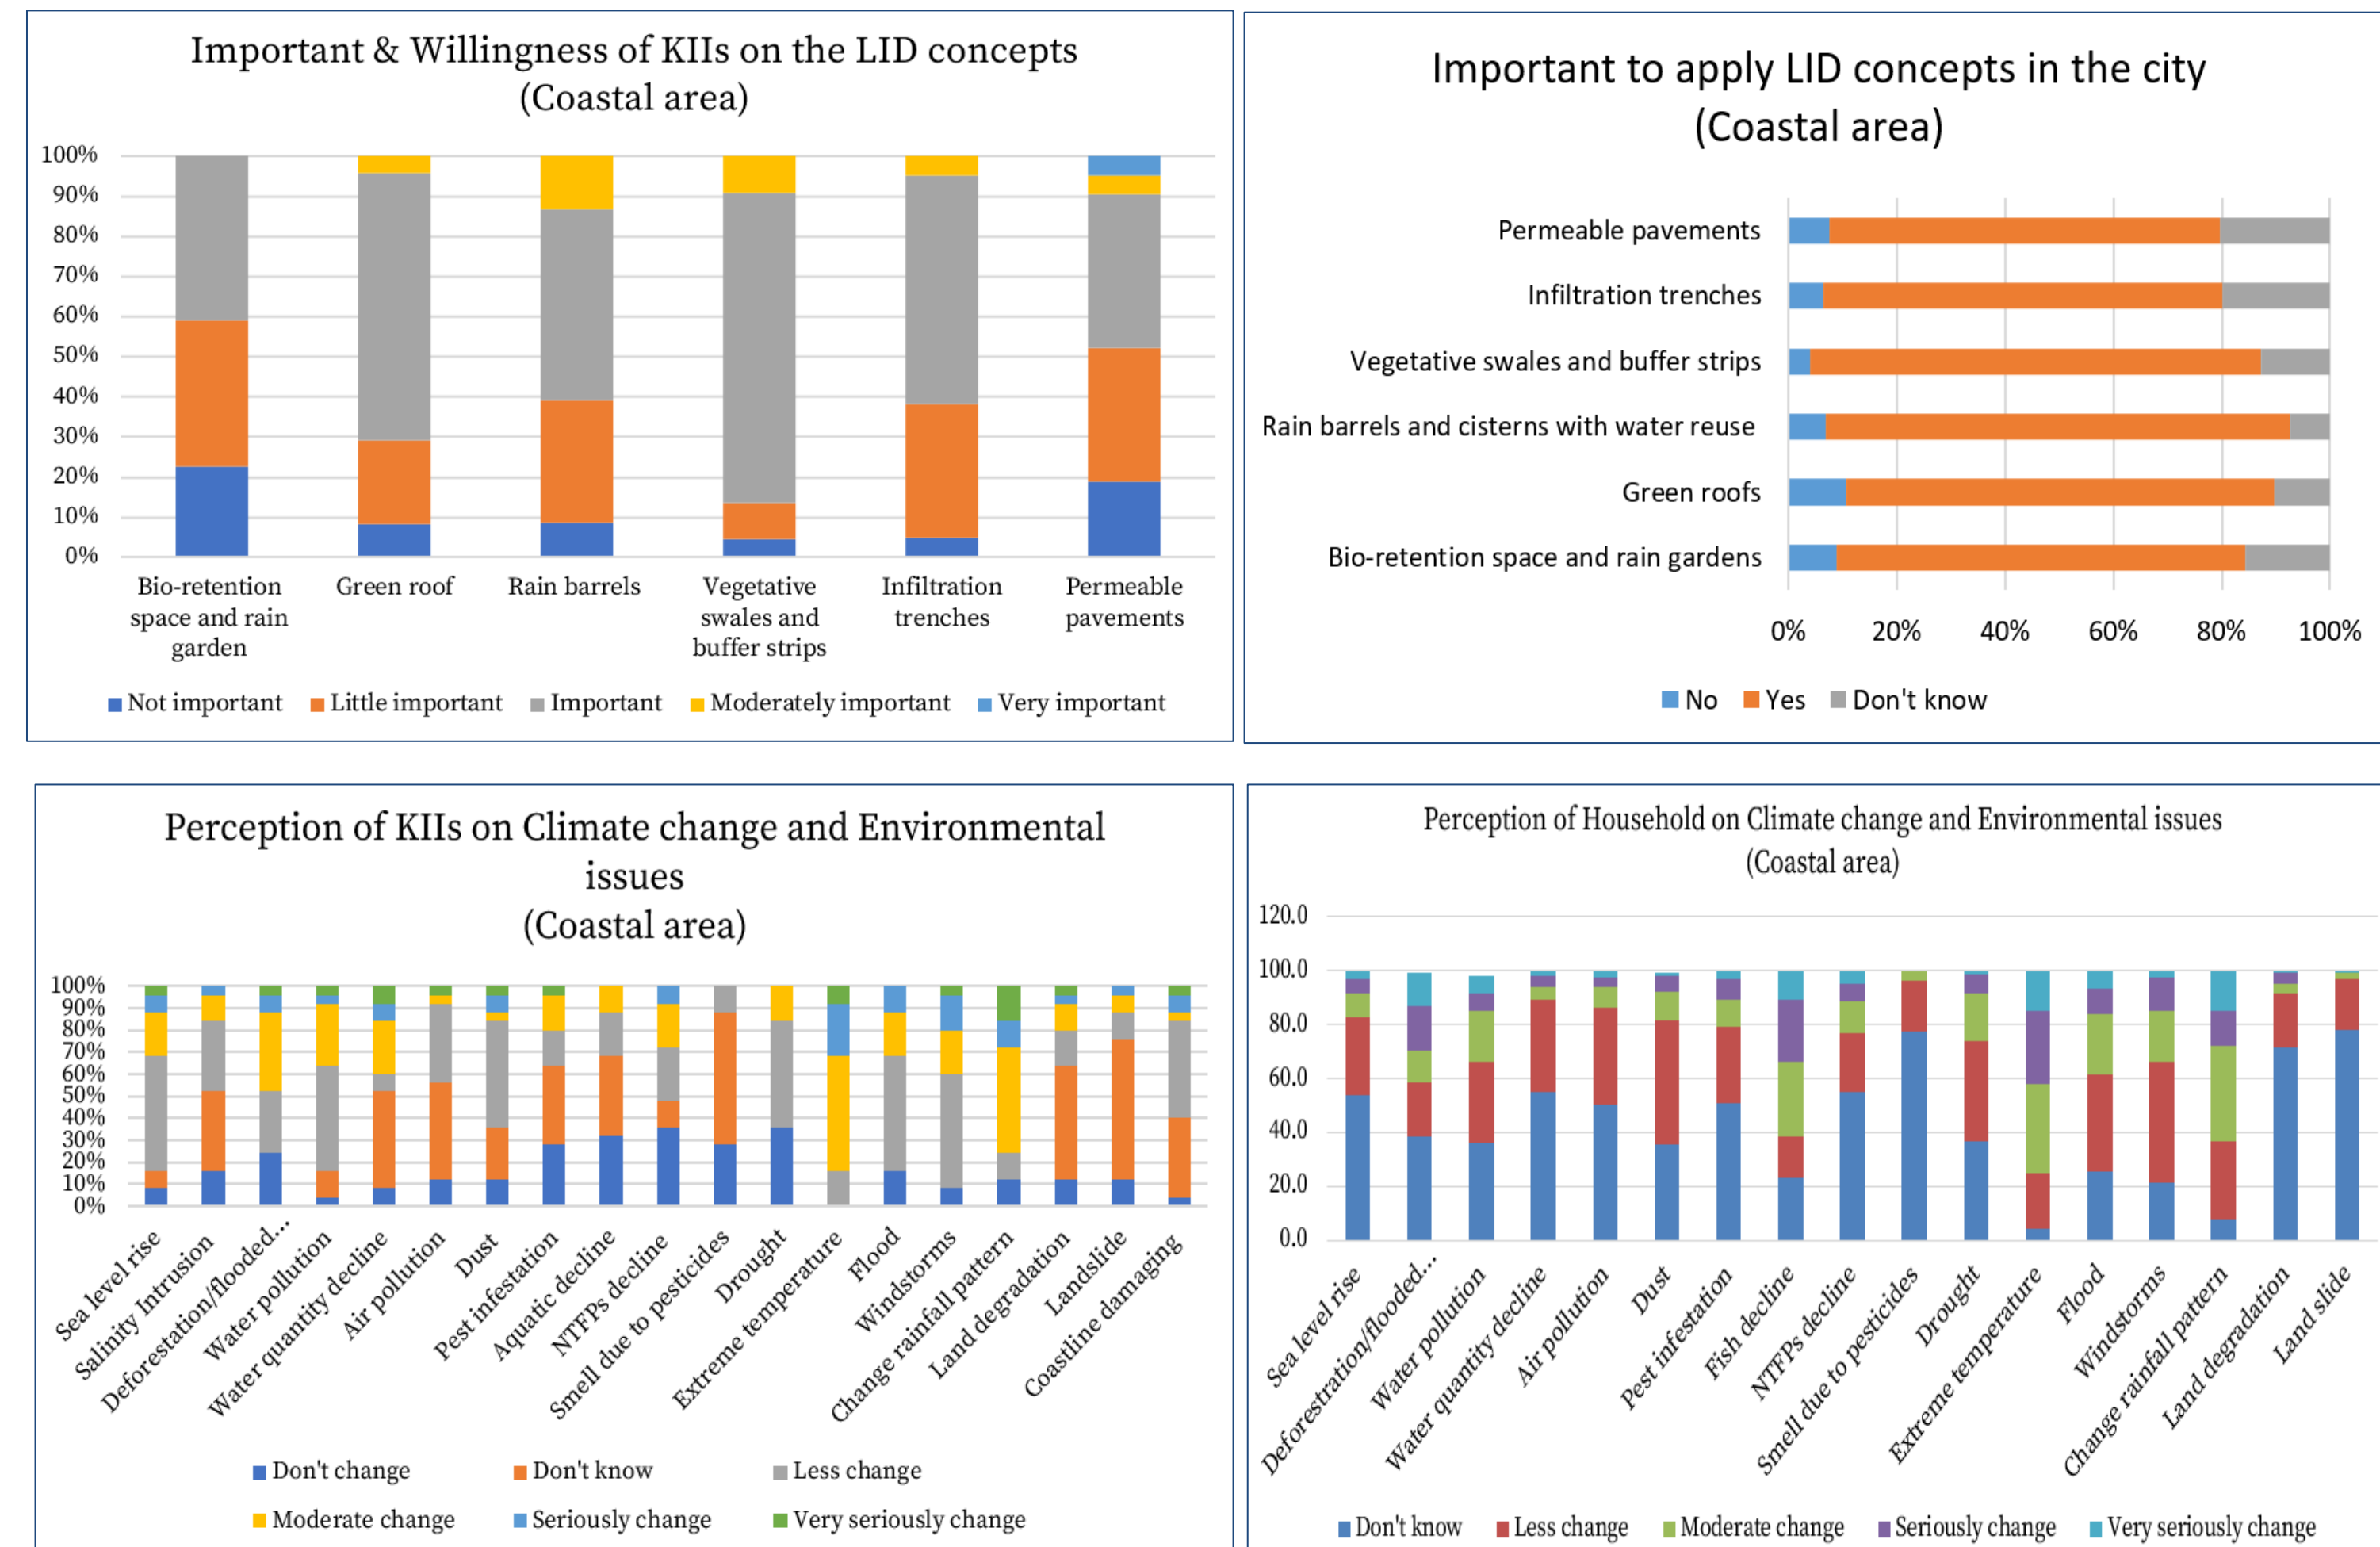

### Data collection

No	Province	FGD	KIIs	HH
1	Preah Sihanouk	1	7	63
2	Kep	1	6	41
3	Kampot	1	6	56
4	Koh Kong	1	8	49
5	National level	0	1	0
Total		4	28	209

### Data analysis

Kobo Toolbox, Microsoft Excel, Likert scale (understand level perception of low and high on climate change and the concept of LID)

## Results and Discussion

- Vegetative swales and buffer strips, Infiltration trenches are preferable in the cities especially in Preah Sihanouk and Kampot
- Willing to share, learn and participate
- Mostly focus on waste management and drainage system construction
- Climate change and environmental issues: Waste, Flood, Windstorm, Change rainfall pattern, Aquatic resources declination, and Land grabbing (beach area)

## Conclusion and Recommendations

- Stakeholders and local people do not have much knowledge on the concept of LID => Provide training and workshop for capacity building on LID concepts and extension of infrastructure development
- Woman are not strongly involved in activity of development and decision making => Should be involved and encouraged to participate
- Development activities in the coastal: construct building, road, waste management but they did apply more on the LID concepts => Provide training, extension on LID concepts to sub-national level
- Climate change and environmental issues : Waste, Flood, Windstorm, Change of rainfall pattern, Aquatic resources declination, and Land grabbing (beach area) => All relevant stakeholders must involve to reduce issues by integrated LID concepts in the future development plan

## Lessons learned and Next Steps

- Lack of knowledge for some respondents to respond with some questions on the LID concepts
- Time constrain
- Cannot meet with technical experts during interviewing for KIIs

=> Will bring technical experts and relevant stakeholders to participate and discuss together in the engagement workshop, training workshop, and endline survey workshop in 2022 and 2023 in order to build their capacity, verify their knowledge, and conduct endline line study on LID concepts.

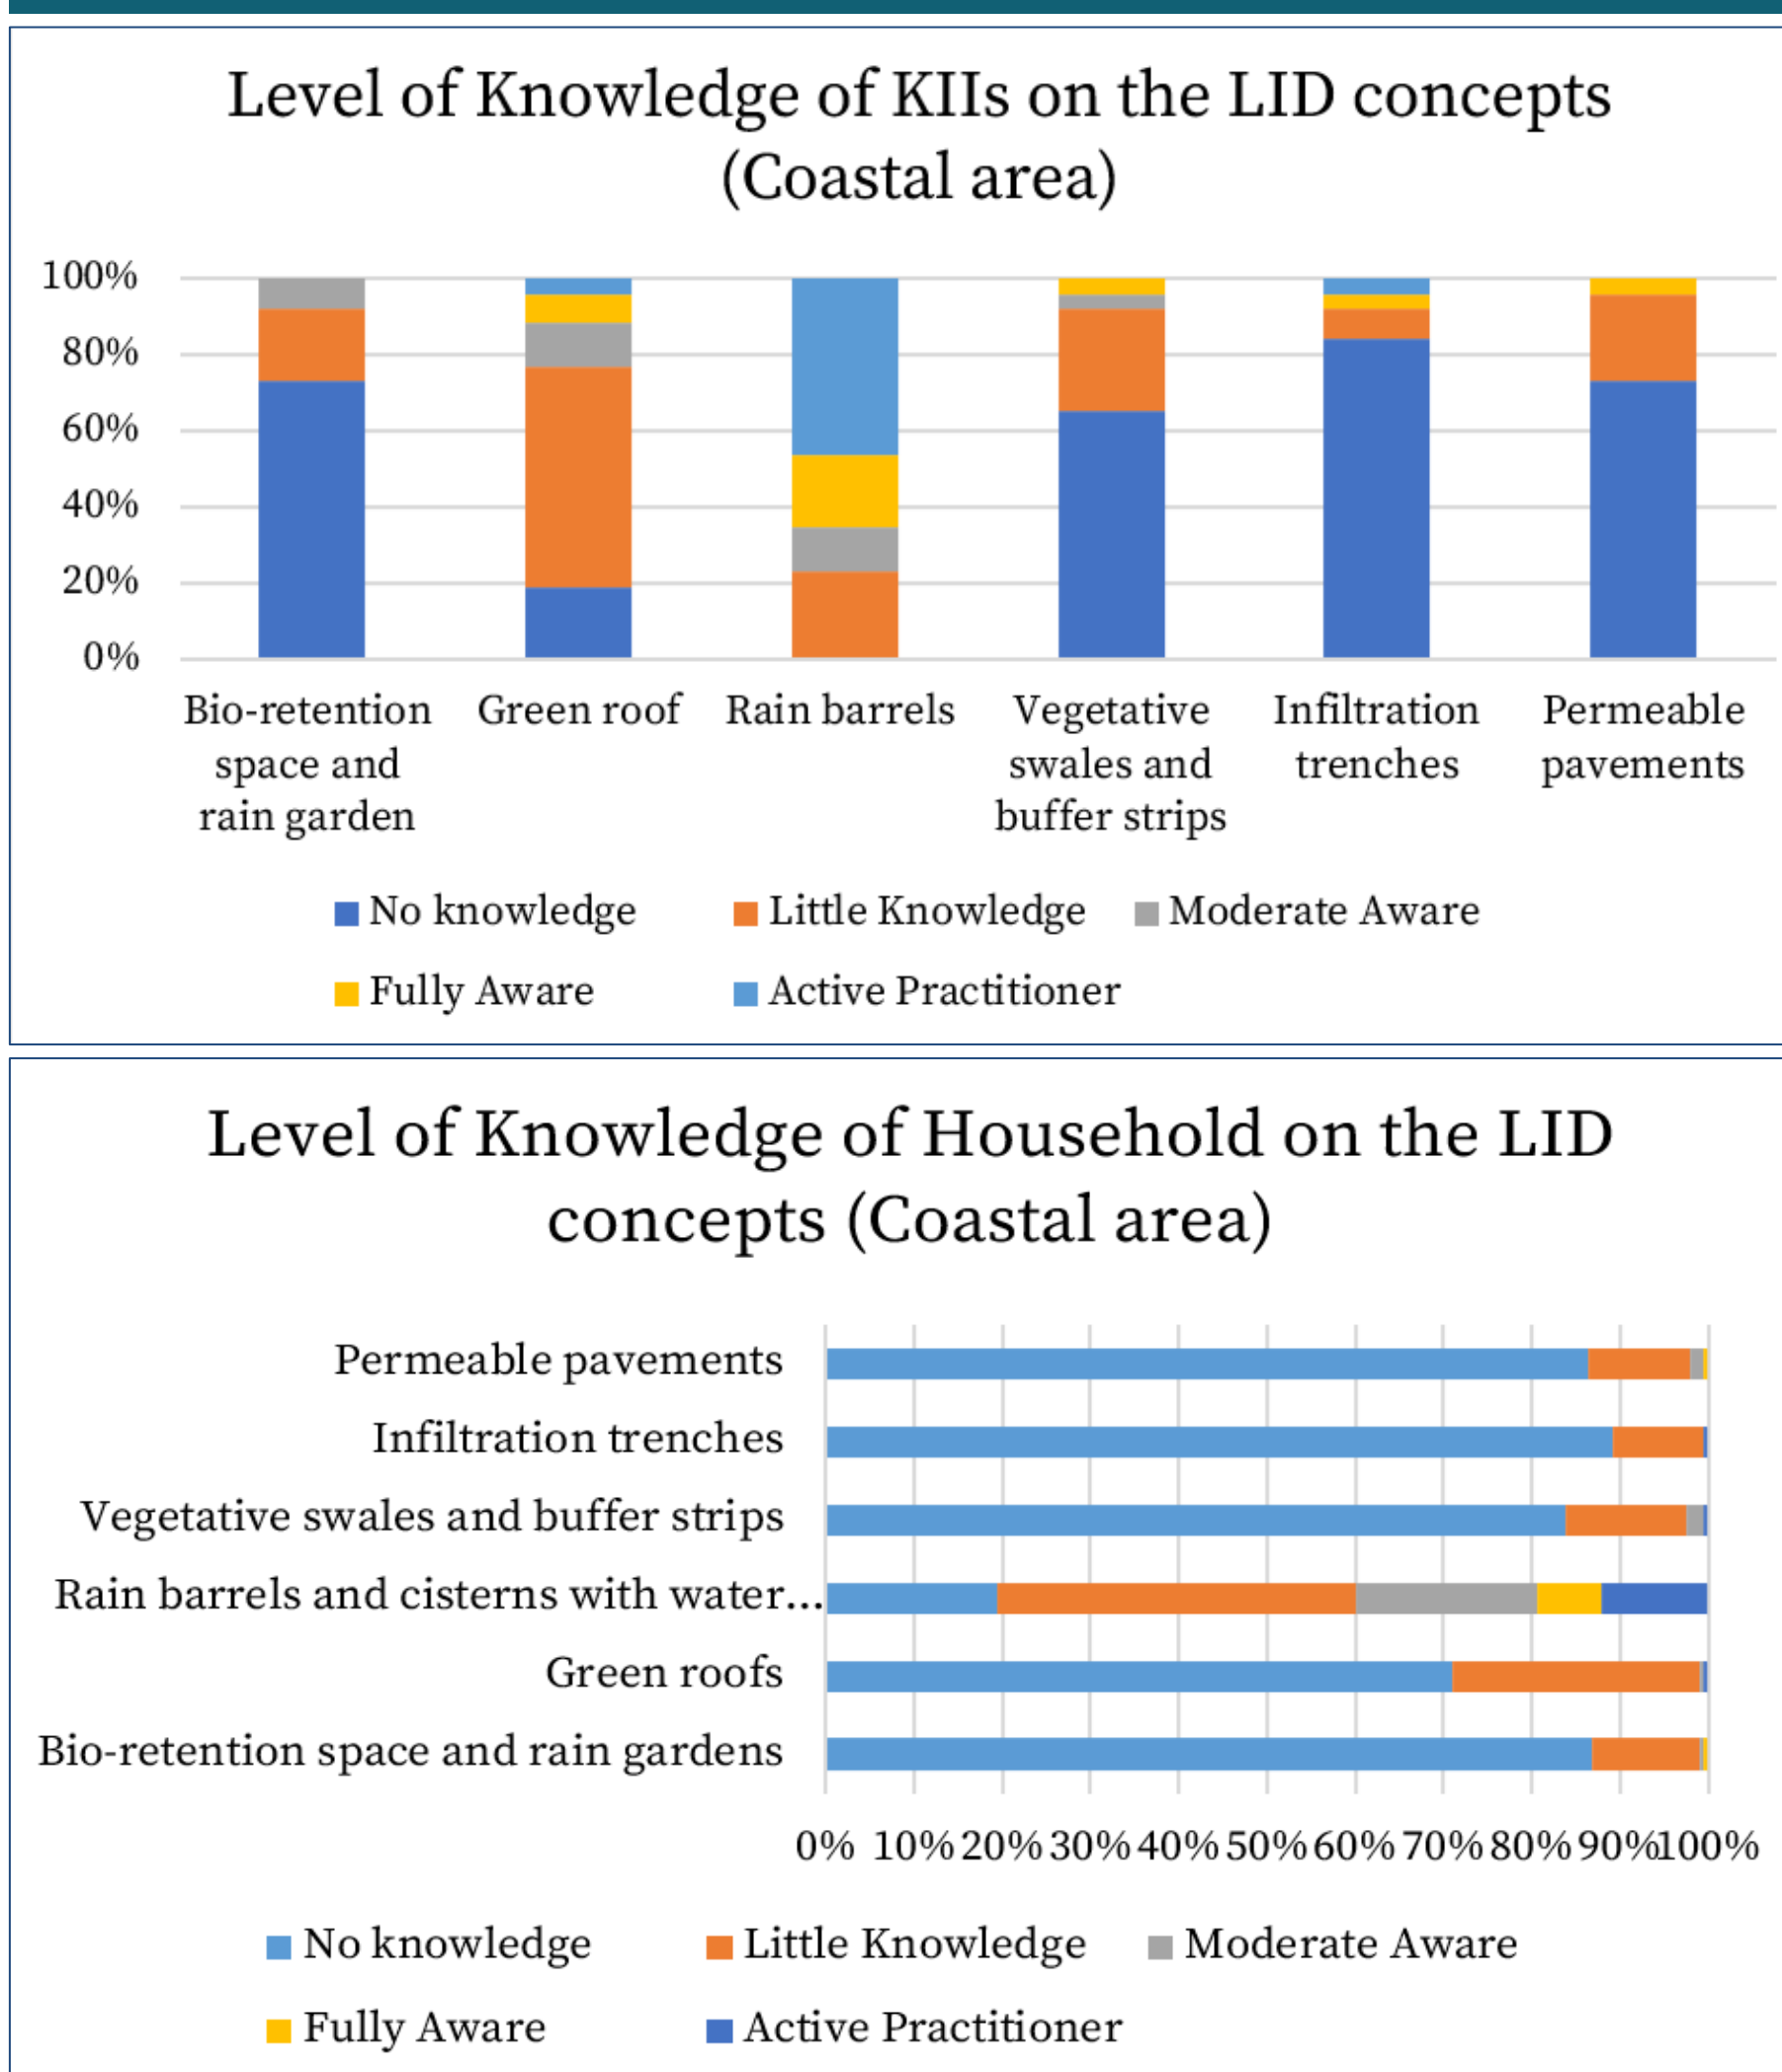

## Acknowledgement

- Thanks to Cambodia Climate Change Alliance- phase 3 (CCCA3) for funding grant of doing this research.
- Thanks to Institute of Technology of Cambodia (ITC) for coordinating the project.
- Thanks to Royal University of Agriculture (RUA) for collaborating and implementing the baseline study of project.
- Thanks to all key stakeholders for actively participate in the survey.

Figure 2 Stakeholder engagement

## Results and Discussion

- Gap of knowledge between national and sub-national level
- Few of KIIs and households have knowledge on the LID concepts
- Women are involved in every sector and department
